

GE 222/352/503(C2)

This sheet is provided to aid in the installation of your remanufactured General Electric controller. Upon installation, you may encounter problems that may, or may not, be due to a faulty controller. The following steps must be taken to help diagnose a possible cart fault or faulty controller. An analog or digital volt ohm meter (VOM) will be needed to perform these checks

WARRANTY WILL BE VOID **If These Steps are Not Performed Before Installing The Control**

➔ STEPS TO PERFORM **BEFORE** CONTROL INSTALLATION ➔

CHECK MOTOR WINDINGS:

- Set your VOM to RESISTANCE (Ω).
- With your motor disconnected, measure A1 to A2. This must measure BETWEEN $.3\Omega$ and 1Ω .
- With your motor disconnected, measure F1 to F2. This must measure BETWEEN 1Ω and 2Ω .
- With your motor disconnected, measure A1 to F1. This must measure OPEN.
- With your motor disconnected, measure F1 to motor case. This must measure greater than $5M\Omega$.

CHECK MAIN SOLENOID:

- Disconnect all wires from the main solenoid.
- Set your VOM to RESISTANCE (Ω).
- Measure the solenoid coil. This must measure NO LESS than 180Ω .
- Connect VOM leads to the main solenoid lugs.
- Attach jumpers from main battery positive and negative to the coil (small terminals).
- Meter must jump from infinity to LESS THAN $.3\Omega$.
- Remove jumpers and reconnect solenoid wiring from the harness. (If suppression diode is present, The non-banded side must go to the blue/white wire – from pin 11 from controller.)

CHECK THE CART WIRE HARNESS:

- Check the connectors on the wire harness for corrosion, loose, broken, burnt or missing pins.
- Repair or replace pins as necessary.

**IF ANY OF THE ABOVE ITEMS ARE NOT WITHIN THE SPECIFIED RANGES THE CONTROLLER WILL FAIL.
THESE ITEMS MUST BE CORRECTED BEFORE THE CONTROLLER IS INSTALLED OR WARRANTY WILL BE VOID.**

It is recommended to replace your solenoid at the time of controller replacement. FSIP now stocks popular replacement White Rodgers solenoids for your convenience.

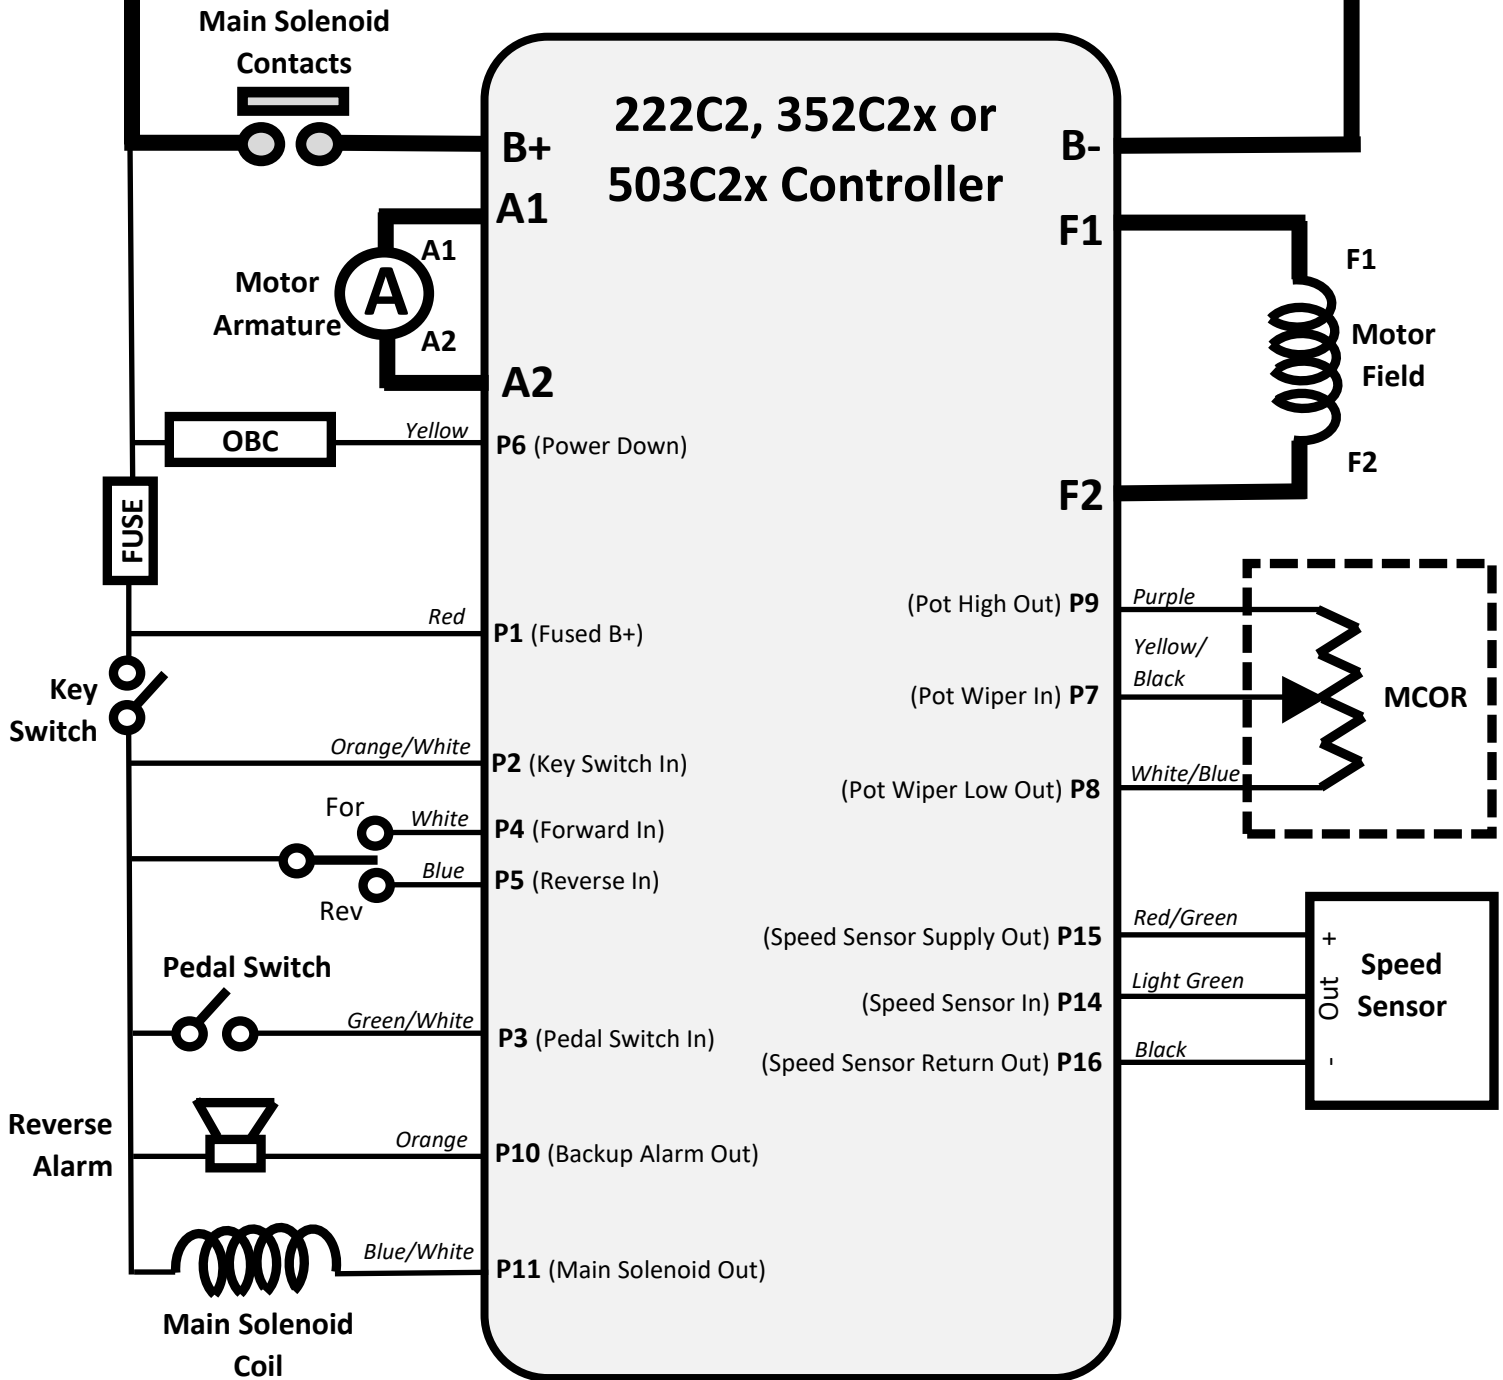

Diagram shows the back (wire) side of Connector

Club Car Regen2 Troubleshooting Sequence

FOR SAFETY, ALWAYS LIFT THE DRIVE WHEELS OFF THE GROUND WHEN TROUBLESHOOTING!

ALL TESTS ARE CONDUCTED WITH A GOOD BATTERY PACK VOLTAGE MEASUREMENT. ALSO, THE CONNECTOR MUST BE ATTACHED TO THE CONTROLLER WHEN MAKING THESE CHECKS. YOU WILL NEED TO 'BACK PROBE' THE PINS FROM THE WIRE SIDE OF THE CONNECTOR. USE A PAPERCLIP IF NECESSARY.

Attach voltmeter negative (-) lead to main battery – for the following tests

Use the following sequence when checking individual pins (don't skip steps). **If you find a fault, do not move on to the next step until the fault is corrected:**

- Measure the voltage at the main battery positive post (let's call it Pack Voltage)
- Pin 6 With charger disconnected**, must be greater than 30V (if less than 30V this control will be dead)
 - If not, your OBC may be in sleep mode. Put your cart on charge for 1 minute, disconnect then recheck. If you still do not have more than 30V at this pin, you may have an OBC issue
- Pin 1** Must be equal to Pack Voltage
 - If not Pack Voltage, check wiring and Fuse
- Pin 2 With Key Switch Off**, must equal 0 volts
 - If not 0 volts, check wiring and Key Switch for a shorted condition
- Pin 2 With Key Switch On**, must equal Pack Voltage
 - If not Pack Voltage, check wiring and Key Switch for an open condition
- Pin 4 With F/R Switch in Reverse**, must equal 0 volts
 - If not 0 volts, check wiring and F/R Switch for a shorted condition
- Pin 4 With F/R Switch in Forward**, must equal Pack Voltage
 - If not Pack Voltage, check wiring and F/R Switch for an open condition
- Pin 5 With F/R Switch in Forward**, must equal 0 volts
 - If not 0 volts, check wiring and F/R Switch for a shorted condition
- Pin 5 With F/R Switch in Reverse** must equal Pack Voltage
 - If not Pack Voltage, check wiring and F/R Switch for an open condition
- Pin 3 With Pedal Up**, must equal 0 volts
 - If not 0 volts, check wiring and Pedal Switch for a shorted condition
- Pin 3 With Pedal Down**, must equal Pack Voltage
 - If not Pack Voltage, check wiring and Pedal Switch for an open condition
- Pin 10 With Direction Switch in Neutral**, must equal Pack Voltage
 - If not Pack Voltage, check wiring and make sure beeper is present and connected
- Pin 10 With Direction Switch in Reverse**, must equal approximately 0 volts (and beeper sounds)
 - If not approximately 0 volts, check connector and wire terminal for being burnt/corroded. If terminal is clean, controller may be defective
- Pin 8** Must equal 0 volts
 - If not 0 volts, check connector and wire terminal for being burnt/corroded. If terminal is clean, controller may be defective
- Pin 9** Must equal approximately 3.5 volts
 - If not approximately 3.5 volts, check connector and wire terminal for being burnt/corroded. If terminal is clean, controller may be defective

Continued on next page ...

- Pin 7 *With Pedal Up***, must be less than approximately .5 volts
 - *If not less than approximately .5 volts, check wiring and MCOR for shorted condition*
- Pin 7 *With Pedal Fully Down***, must equal approximately 3.5 volts
 - *If not approximately 3.5 volts, check wiring and MCOR for open condition*
- Pin 15** Must equal approximately 11.5 volts
 - *If not approximately 11.5 volts, remove speed sensor to see if voltage recovers to 11.5 volts. If it does return to 11.5 volts, replace speed sensor, if it does not return to 11.5 volts, check wiring*
- Pin 16** Must equal approximately 0 volts
 - *If not approximately 0 volts, check terminal for being burnt/corroded. If terminal is clean, controller may be defective.*
- Pin 14 *While slowly turning the drive wheel***, must toggle between 0 volts and approximately 4.5 volts
 - *If not toggling, check wiring and if necessary replace Speed Sensor and magnet*
- Pin 11 *With Pedal Up***, must equal approximately pack voltage
 - *If not approximately pack voltage, check solenoid coil and wiring for an open condition*
- Pin 11 *With Pedal Down***, must equal approximately 0 volts
 - *If not approximately 0 volts, check terminal for being burnt/corroded. If terminal is clean, controller may be defective.*

Helpful Hints

- DO NOT UNDER ESTIMATE THE IMPORTANCE OF MOTOR RESISTANCE CHECKS AND MAIN SOLENOID CHECKS. MANY CART ISSUES ARE CAUSED BY BURNT/DAMAGED BRUSHES THAT WILL BE FOUND AS PART OF THE ARMATURE RESISTANCE CHECK. ALSO A SHORTED ARMATURE AND FIELD WITHIN THE MOTOR WILL DAMAGE THIS CONTROLLER.**
